

ILUKA

South West
Digital
Herbarium

July 2016

Iluka Resources Limited (Iluka) is a major global participant in the mineral sands industry. The company has been involved in mineral sands exploration, mining, processing, marketing and rehabilitation for over 60 years and currently has operations in Australia and the United States, as well as a global sales, marketing and distribution network. Iluka is the largest producer of zircon – possessing the largest international market share – and is also the largest producer of the high grade titanium dioxide products rutile and synthetic rutile (upgraded ilmenite).

Throughout its history, Iluka has operated and continues to operate mineral sands mines and processing facilities within areas of diverse geography and vegetation. These include the South West and Mid West regions of Western Australia; the Murray Basin in western Victoria; the Yellabinna Nature Reserve in South Australia; and various locations in the United States. During this period Iluka has rehabilitated over 12,000 hectares of land, restoring former mine sites to native vegetation and productive agricultural use.

One notable example is the former Yoganup mine, located approximately 10 kilometres from the town of Capel in the Southwest of Western Australia. Mining occurred at the Yoganup site from 1956 to 2008 and necessitated the disturbance of 353 hectares of land, of which 340 hectares have been rehabilitated.

The Yoganup site is located on the Whicher Scarp in the South West of Western Australia. The region is recognised for its high conservation values.

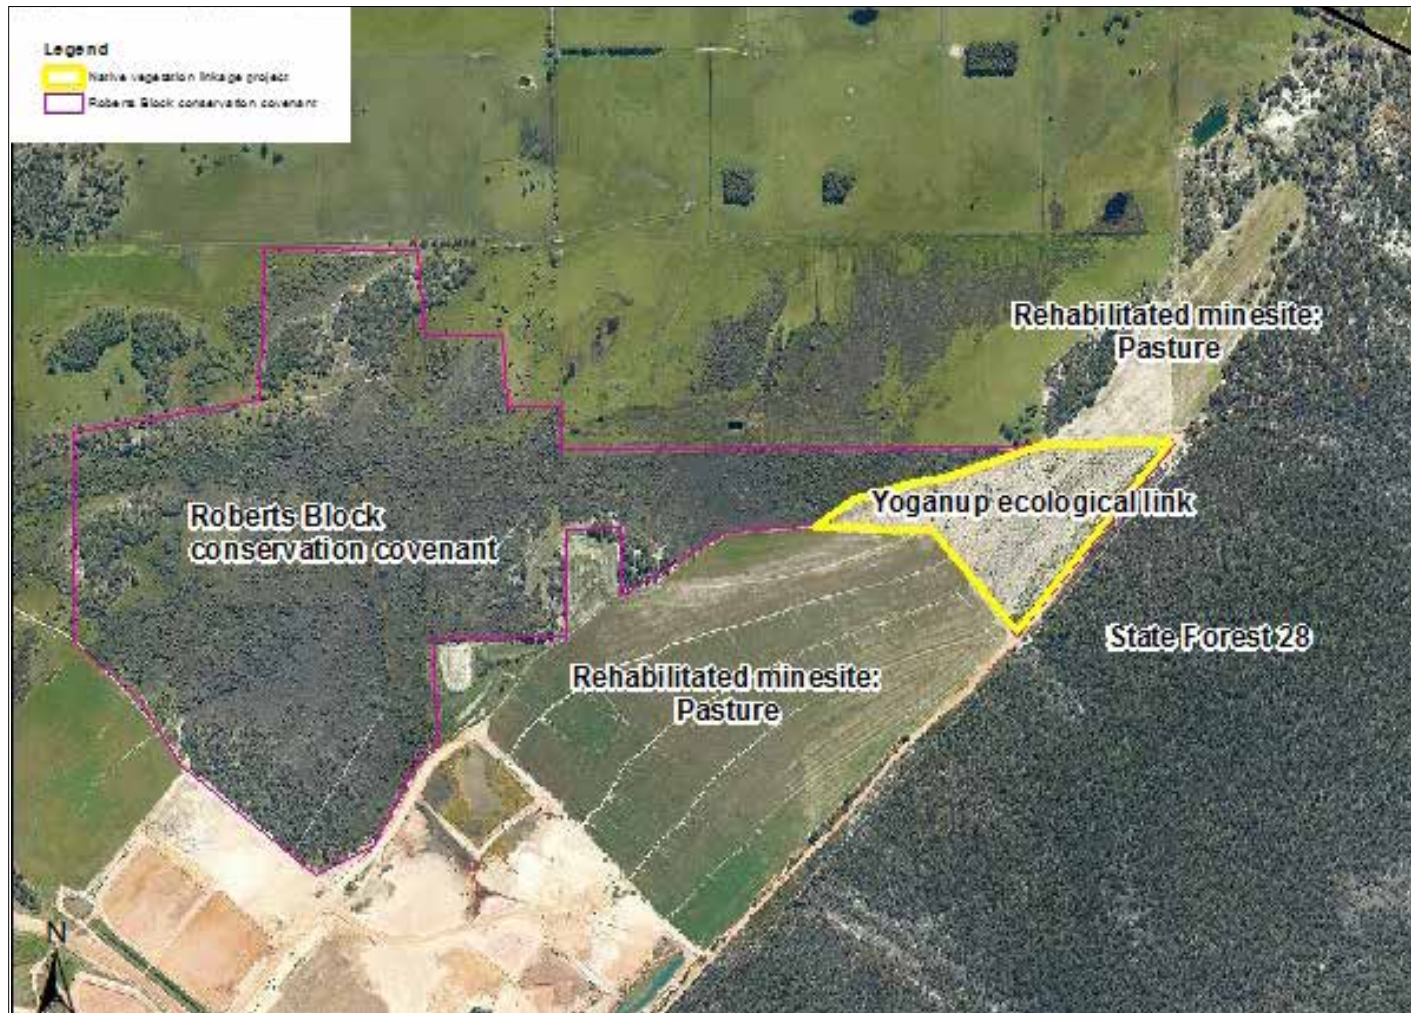

This scarp forms a gentle incline dominated by sandy and lateritic soils. It is covered mostly by woodlands, with patches of shrub lands. Plant communities reflect elements of the flora of the Jarrah Forest and the Ridge Hill Shelf. A series of rivers and creeks incise the scarp and support the wider ecosystem. Landforms, flora and fauna are varied, with the scarp reflecting species richness, endemism and geographical distinctiveness.

Pre-mining vegetation across the deposit and the surrounding area was largely agricultural pasture and crops, with small remnant vegetation areas. Remnants tend to occur on the less fertile sandy rises or in the wetter areas that are inundated seasonally.

As part of the ongoing rehabilitation activities of the site, Iluka revegetated approximately 12 hectares of land in 2014 known as the Yoganup ecological link. This newly established corridor of native vegetation links State Forest 28 (Whicher Scarp vegetation) and the remnant 'Roberts Block' that is protected by conservation covenant. This conservation value remnant vegetation land is being excised to the Western Australian Department of Parks and Wildlife.

Location of Yoganup Mine.

Location of the native vegetation linkage project (aerial photograph: 2015)

During initial planning, it was evident no herbarium of juvenile plant species for the Whicher Scarp existed, which caused the identification of juvenile plants as part of the monitoring process to be difficult. Iluka rehabilitation professionals subsequently established a series of herbarium sheets for juvenile plant identification. These sheets contain information on botanical descriptions, flowering, seed collection timing, locations, average germination numbers per gram, best treatments and storage to guide rehabilitation activities, with photographic images for each species also included.

This resource has considerably enhanced Iluka's rehabilitation of the Yoganup site and future work at the Tutunup South mine 20 kilometres to the south. This approach has also guided general environmental management and planning practices undertaken throughout the company.

In the interests of collaboration and knowledge sharing, Iluka is pleased to make this information available publically. Iluka acknowledges the resource is currently incomplete but feels there is still significant value in releasing the information in its current form. The company will endeavour to update this document as further information becomes available. Visit www.iluka.com to download this resource.

Herbarium sheets for juvenile plant identification

Acacia divergens

FABACEAE

Name Derivation Pointed instrument / Spreading outwards

Plant Description

SHRUB: To 2.5m in height. Erect, branchlets finely ribbed. Stipules persistent, often spiny.
PHYLLODES: Obtriangular, 6-10mm long and 3-8mm wide, one edge lies parallel to the branchlets and has a gland at its angle, midrib prominent.
INFLORESCENCES: Simple. Heads, One in each axil on slender stalks 3.5-10mm long, Heads globular, cream to pale, 5-10 flowers.
FLOWERING: Winter to Spring calyx 4-lobed, petals 4.
PODS: Blackish, linear, curved up to 70 mm long and 2-3mm wide and hairless.

Acacia divergens

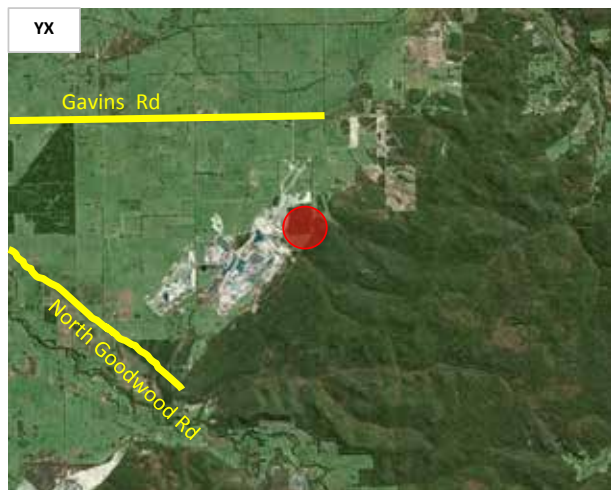

FABACEAE

Acacia extensa

FABACEAE

Name Derivation	Pointed instrument / Spreading												
Plant Description	SHRUB: 3m, slender, rush like, hairless. Branchlets angled or narrowly winged. Green with yellow ribs.												
	PHYLLODES: Similar to branchlets, 60-240mm long and 0.8 - 1.8mm wide, 5-veined, normally 5-sided in section.												
	INFLORESCENCES: 1-several-headed, heads on stalks 3-8mm long, globular, yellow 6-6.5mm across, 12-24 flowered.												
	FLOWERS: Calyx 5-lobed; petals 5.

Acacia extensa

FABACEAE

Acacia lateritica FABACEAE

Name Derivation Pointed Instrument / On laterite soils.

Plant Description

SHRUB: To 1.5m single or many stemmed, spreading to erect. Branchlets ribbed usually with long hairs.
LEAVES: Twice pinnately-divided, usually hairy, leaf stalk 1.5mm long pinnae (1)2(3) pairs, each with 1-6 pairs of leaflets, narrowly oblong to narrowly ovate, 4-8(15)mm long and 1.5-3mm wide, margin more or less recurved. Gland single on leaf axis, between first and second pinnae.
STIPULES: 2-4mm long, brown. **FLOWERS:** Calyx 1.5mm long united, 5-lobbed; petals 5, .25-2mm long
PODS: Dark brown narrowly oblong, 30-50mm long and 7-11mm wide, usually hairy.

Acacia lateritica

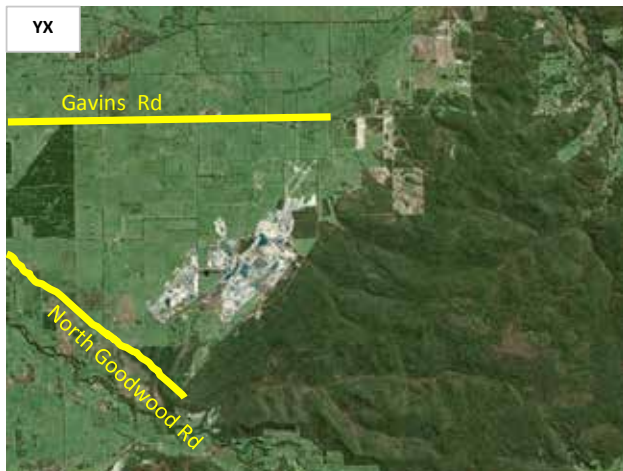

FABACEAE

Acacia nervosa

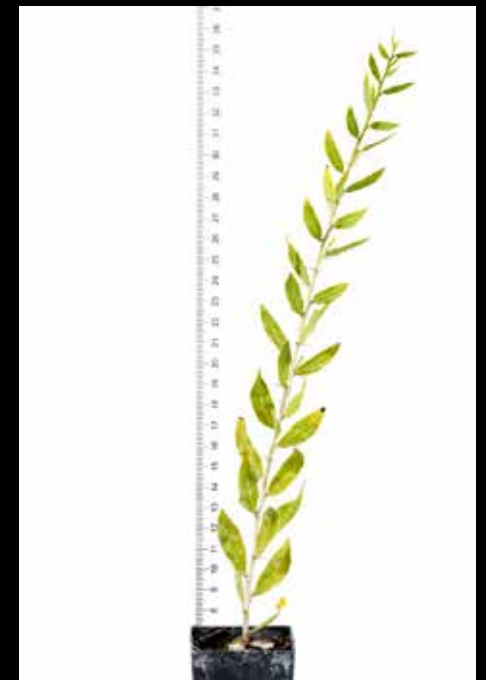

FABACEAE

Name Derivation	Pointed Instrument / Prominent nerves (veins) on the phyllodes.											
Plant Description	SHRUB: To 0.5m, hairless, erect or sprawling. Branchlets ribbed with a whitish bloom between the ribs. Stipules persistent spiny, 3-8mm long.											
	PHYLLODES: Narrowly elliptic to ovate, 15-50mm long and 10-25mm wide, curved, often sharp pointed. Midrib and marginal vein conspicuous, gland 2-12mm above base.											
	FLOWERS: Calyx 4-lobed, Petals 4. INFLORESCENCES: Of 2-4 heads per axil, on 5-18mm stalks; Heads globular, golden, 7-9mm across, 7-12 flowered.											
	PODS: Reddish brown, narrowly oblong, up to 50mm long and 8-9mm wide, more or less woody, twisted with thick pale margins.

Acacia nervosa

FABACEAE

Acacia obovata

FABACEAE

Name Derivation Pointed Instrument / Egg shaped, broadest part around middle.

Plant Description

SHRUB: To 1m in height. Many slender stems, Branchlets hairy and ribbed. Stipules persistent, not spiny.

PHYLLODES: Elliptic to obovate, 15-50mm long and 10-25mm wide, sometimes sharply pointed margins wavy midrib and marginal veins raised and hair, gland large.

INFLORESCENCES: Flowers late Autumn to early Spring. Simple, 1 flower stalk in each axil 10-20mm long heads globular, white to pale yellow, 5-7mm across, 5-9 flowered. Calyx 4 lobed and petals 4. **PODS:** Blackish, linear up to 110mm long 5-6 mm wide, hairless with thick pale margins.

FABACEAE

Acacia saligna

FABACEAE

Name Derivation Pointed Instrument / Resembling a willow.

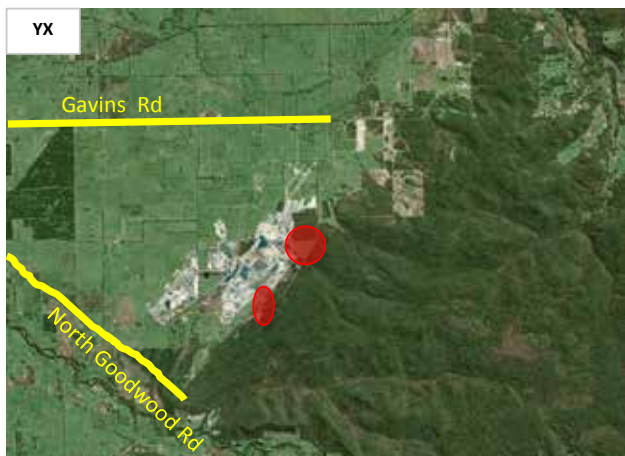

Plant Description
SHRUB: To Small tree to 6(10)m with smooth grey bark, branchlets smooth and hairless, often weeping and slightly curved.
PHYLLODES: Often white-wavy, linear to narrowly ovate elliptic and somewhat curved. 70-250mm long 4-30mm wide, pointed, midrib prominent.
INFLORESCENCES: Axillary 3-30mm long 2-10 headed, heads on stalks 5-15mm long globular, yellow to orange, 7-10m across, 25-55 flowered.
FLOWERS: Winter and Spring. Calyx very short 5 lobed, 5 petals.
PODS: Light brown, linear 80-120mm long and 4-6mm wide, flat with thickened paler margins and constricted between the seeds, the valves remaining straight.

Adenanthos barbiger PROTEACEAE

Name Derivation Gland, Flower (at base of ovary) / Bearded

Plant Description

SHRUB: To 1m in height. Many stemmed. Leaves alternate or almost opposite, almost stalkless, linear or narrowly elliptic-obovate to elliptic-obovate, 15-80mm long and 4-12mm wide, flat hairless or sparsely hairy, entire, tip rounded.

FLOWERS: Scarlet red, bracts densely hairy and fringed, pointed, floral segments 20-30mm long with sparse to dense long hairs outside. One of the anthers sterile. Style 35-40mm long with spreading hairs. Style-end red approx 3 mm long.

FRUIT: approx 6mm long.

Adenanthos barbiger

PROTEACEAE

Adenanthos meisneri PROTEACEAE

Name Derivation Gland, flower at base of ovary / Baron Von Meisner (German Botanist)

Plant Description

SHRUB: Ground hugging or to 1m. **FRUIT:** Approx. 5mm long.

LEAVES: Stalked, fan shaped and 6-15mm long, deeply dissected into 3 primary segments each of which is divided into 3 more secondary segments.

FLOWERS: Pink to red or purple, Bracts hairless or almost so but fringed, pointed; Floral segments 20-30mm long with glandular and non glandular hairs outside. Anthers all fertile-style at 35-40mm long hairless, style-end approx 1mm long.

Agonis flexuosa MYRTACEAE

Name Derivation A collection of small, tight, globular flower heads / Stems that change directions at nodes.

Plant Description

TREE: Erect or Weeping tree to 10m, a wind pruned mallee or small shrub. Branchlets often zigzagging.
LEAVES: Alternate, very narrowly elliptic to narrowly ovate, 20-120mm long and 3.5-12mm wide, flat or somewhat twisted, tip pointed.
FLOWERS: In Spring, clusters axillary, globular, bracts broad, 1-1.5mm long, hairy at least on keel rounded. Flowers white.

Agonis flexuosa

MYRTACEAE

Agrostocrinum scabrum

HEMEROCALLIDACEAE

Name Derivation Grass Lilly / Rough due to short stiff hairs or minute projections.

Plant Description

HERB: To 0.9m in height. Stems, annual, simple or branched. Radiating from a perennial rootstock.
LEAVES: Basal and alternate up the stem, grass-like, lacking a distinct sheath, flat, folded near base. 20-350mm long and 1.5mm wide.
INFLORESCENCES: Terminal loose, exceeding the leaves, with several to many flowers.
FLOWERS: Spring and early Summer, bright blue, bisexual, 25-35mm across 6 petals all similar, free 11-20mm long, spirally twisting with age.
FRUIT: A celled capsule, 4-5mm long and 4-7mm wide.

Allocasuarina humilis

CASUARINACEAE

Name Derivation Drooping branches, resembling bird feathers (Cassowary) / Small.

Plant Description

SHRUB: To 2m. Branchlets up to 120mm long, circular in cross section to shallowly 5-7 ribbed.
LEAVES: Scale in whorls of 5-7, apressed, 0.4-0.5mm long.
FLOWERS: Late winter. Male and Female flowers together on the same plant or separate plants. Male inflorescences 6-18mm long.
CONES: Cylindric, 12-30mm long and 10-18mm wide, cone valves warty with several small protuberances.
NUT: Dark brown, 4-8mm long.

Habitat

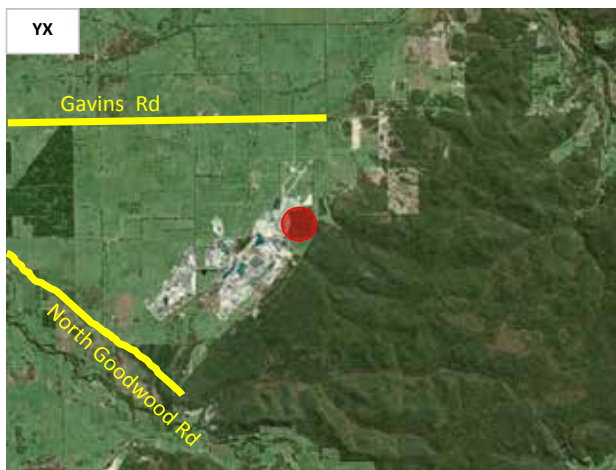

Rehab Veg Community Haemotoxylon on Clay Jarrah on Laterite Cartis

Allocasuarina humilis

CASUARINACEAE

Allocasuarina fraseriana CASUARINACEAE

Name Derivation Drooping branches, resembling bird feathers (Cassowary) / Sir Malcom Fraser

Plant Description

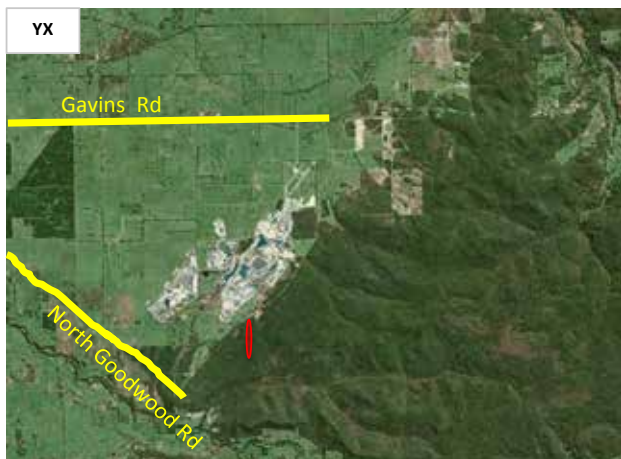

TREE: To 15m, Rough fibrous bark, branchlets up to 300mm long, shallowly 6-8 ribbed.
LEAVES: Scale, in whorls of 6-8, spreading to recurved, 0.7-1.2mm long.
FLOWERS: Male and Female flowers occurring on separate plants, male inflorescences 30-120mm long.
CONES: Shortly cylindric, 15-40mm long and 15-20mm wide, cone valve warty with several rough protuberances.
NUT: Dark brown often with paler markings 9-10mm long.

CASUARINACEAE

♀

♂

Amphipogon amphipogonoides POACEAE

Name Derivation Both the glume and palea have ciliate awns.

Plant Description
PERENNIAL GRASS: Erect 0.5m.
LEAVES: Blade 50-150mm long and 0.5-1mm wide, ligule hairs 0.5-1.5mm long.
INFLORESCENCES: Greatly exerted from the uppermost leaf, ovoid, 10-15mm long, Spikelets green to dark grey and often tinged purple, almost stalkless.
FLOWERS: Spring to Summer.
GLUMES: Almost equal, 5-7mm long softly hairy, entire, tapering to a fine point, Lemma 3.5-4mm long, softly hairy, shortly 3-lobed. Each lobe tapering into a short bristle like point.

Habitat **Rehab Veg Community** Jarrah on Laterite

Amphipogon turbinatus

POACEAE

Name Derivation Both the glume and palea have ciliate awns. / Shaped like a top.

Plant Description
PERENNIAL GRASS: Erect to 0.5(0.8)m in height.
LEAVES: Blade 20-150mm long and 0.5-1mm wide. Recurved and twisted.
INFLORESCENCES: Greatly exserted from the uppermost leaf, hemispherical. Spikelets greyish, almost stalkless to short stalked, lowermost empty ones clustered around the base.
GLUMES: Dark grey unequal, entire, tapering apically into short bristle. Late winter to early Summer. Lower glume 10-15mm long, upper glume thinner and 7-12mm long. Lemma 12-20mm long, softy hairy, deeply and finely 3-lobed.

Burchardia congesta

COLCHICACEAE

Callistachys lanceolata

FABACEAE

Name Derivation Beautiful flower spike / Narrow with curved sides tapering to a point.

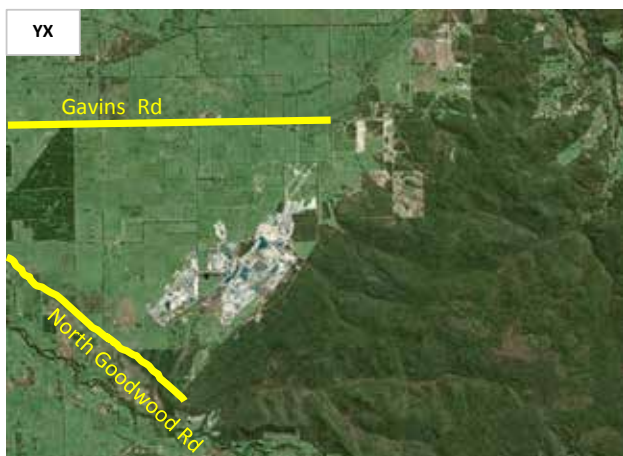

Plant Description **TREE or SMALL SHRUB:** To 8m in height.
LEAVES: Simple, mostly in whorls of 3, sometimes some leaves alternate or opposite, shortly stalked with pairs of stipules, oblong-elliptic or ovate-elliptic 40-170mm long and 4-30mm wide, leathery and flat, with net like veins.
INFLORESCENCES: Slender to terminal.
FLOWERS: Spring to Summer. Yellow or orange, pea-like, bisexual shortly stalked, with floral bracts on the flower stalks shed early. Stamens 10 all free.
FRUIT: Stalk pod slightly compressed, ovoid, ellipsoid, 10-15mm long and 5-7mm wide.

Habitat **Rehab Veg Community** **Wet**
 Whicher Location Map Yoganup, Tutunup South.

Callistemon glaucus MYRTACEAE

Name Derivation Beautiful stamen / Bluish grey, green.

Plant Description
SHRUB or SMALL TREE: To 3m in height.
LEAVES: Dark grey green, alternate, almost stalkless, narrowly elliptic to narrowly obovate, 35-150mm long and 5.5-18mm wide.
INFLORESCENCES: A deep red cylindric spike. **FRUITING SPIKE:** 9-150mm long. **FRUIT:** 3 celled woody capsule, 7-8mm wide.
FLOWERS: Spring and Summer. Bisexual, stalkless with 5 sepals and petals greenish brown, broadly elliptic 4-7mm long. Stamens red 30-50, appearing free but actually fused at base into a ring, much longer than the petals.

Habitat **Rehab Veg Community** Wet

Callistemon glaucus

MYRTACEAE

Calothamnus quadrifidus

MYRTACEAE

Name Derivation Beautiful bush / shrub / Split into four parts.

Plant Description

SHRUB: To 3m in height.

LEAVES: Needle like or linear but thick 9-30mm long and 0.3-1mm wide.

FLOWER SPIKE: Late Winter and Spring. One sided, sometimes interrupted, 15-100mm long, sepals 1-2mm long, petals 3-6.6mm long. Stamens in 4 equal bundles 20-30mm long and 0.8-1.5mm wide, each bundle with 12-25 fertile anthers.

FRUIT: Ovoid - ellipsoid or globular, 6-8mm wide with 2 incurved sepals .

Calothamnus quadrifidus

MYRTACEAE

Calothamnus sanguineus MYRTACEAE

Name Derivation Beautiful bush, shrub / Blood coloured.

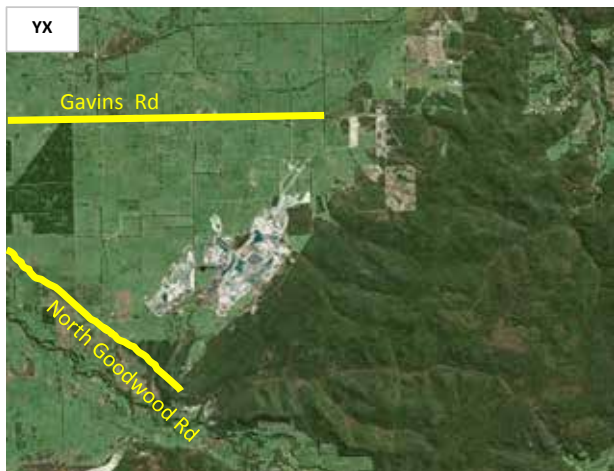

Plant Description
SHRUB: To 1m in height.
LEAVES: Needle like to linear but thick with a flat upper surface and rounded lower surface 6-35mm long and 0.3-1mm wide.
FLOWER SPIKE: Autumn to Spring, Cylindric or one-sided 7-30mm long, interrupted with the flower in clusters, Stamens in 3 unequal bundles with 1 large and 2 small, each with one 1 sterile stamen.
FRUIT: Ovoid to globular or ellipsoid, 8-12mm long and 5-11mm wide with 2 incurved sepals.

Chamaescilla corymbosa

ASPARAGACEAE

Name Derivation Sea onion / Flower heads have a flat top.

Plant Description

HERB: To 0.3 in height. Perennial swollen roots and annually renewed stems and leaves.
LEAVES: Basal, linear 50-250mm long and 2-12mm wide, flat.
FLOWERS: Winter to Spring. Bright blue, bisexual, 10-20mm across, usually 1-20 in loose almost flat topped clusters. Petals 6 all similar, free, 5-11 mm long. Spirally twisting with age, Stamens 6, with anthers 1-2mm long, style thread like.
FRUIT: 3 lobed and 3 celled capsule.

Conostephium pendulum

ERICACEAE

Name Derivation The corolla tube is conical and encloses the stamens / Hangs down, drooping.

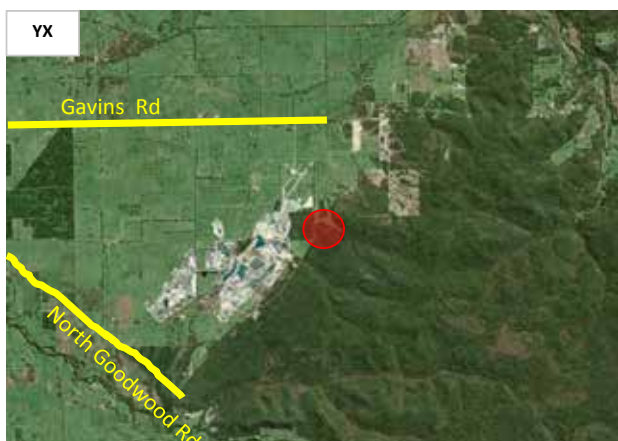

Plant Description
SHRUB: To 0.5m in height.
LEAVES: Alternate, narrowly oblong to narrowly elliptic 20-40mm long and 3-6.5mm wide. Slightly convex, rounded or pointed with a short sharp tip.
INFLORESCENCES: Solitary flowers in the axils of the upper leaves, drooping, stalks and base of flowers covered with numerous small bracts.
FLOWERS: White to cream with a dark purple tip, Sepals 5 broadly elliptic, 7-10mm long appressed to corolla. Corolla tubular and 5 lobed 10-17mm. Stamens 5 included in the corolla with very short filaments and elongated. 2 lobed anthers, slender style, terminal, at length exerted.
FRUIT: 5 celled capsule.

Plant Description

SHRUB: To 1.8m in height. With more or less smooth branchlets circular in cross section.

PHYLLODES: Not continuous with branchlets, similar in appearance or vertically flattened. Very narrowly triangular to narrowly obtriangular and often with a 2-lobed tip, 10-55mm long and 1-10mm wide, spine tipped.

INFLORESCENCE: 2-4 flowered clusters, bracts obovate-elliptic and approx. 1mm long.

FLOWERS: Yellow to orange and red, Calyx 2-2.5mm long, equally 5 lobed, the lobes broad and 0.2-0.3mm long. Standard petal 5-7mm long.

POD: Turgid, 11-13mm long and 10mm wide.

Daviesia physodes

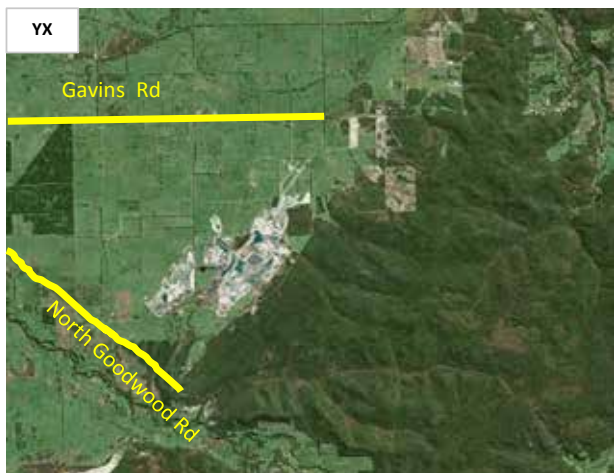

FABACEAE

Desmocladus fasciculatus

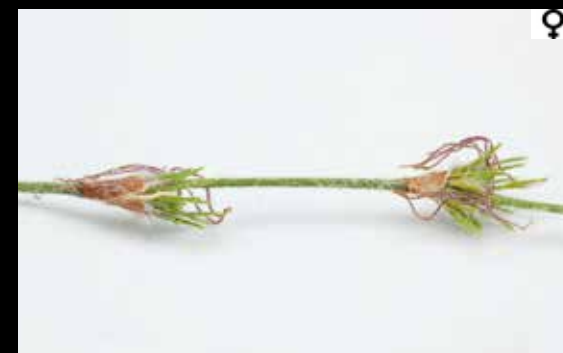

RESTIONACEAE

Name Derivation	Head band like young shoots / Small bundle.												
Plant Description	PERENNIAL HERB: To 0.25m in height. Forming large colonies. Stems arising singly along a long creeping hairy rhizome, erect, 0.5-1mm wide, with long white hairs.												
	LEAVES: Pale brown, sheath 5-15mm long, broad, with hairs along margins, blade 5-15mm long, with a blunt point. Male spikelets solitary and terminating branchlets, pale brown, 4-5mm long bracts 3-5mm long.												
	FLOWERS: Spring. Floral segments 3-4mm. Female spikelets solitary and terminating short branchlets, pale brown, 2-5-4mm long, single-flowered often appearing stalkless. Bracts 2.5-4mm long, floral segments apparently absent.

Desmocladus fasciculatus

RESTIONACEAE

Drosera erythrorhiza

DROSERACEAE

Name Derivation Dewy / Red root.

Plant Description

PERENNIAL HERB: To 80mm in height. With a red tuber.

LEAVES: 3-9 in a flat rosette, becoming red with age, broadly to narrowly obovate, 8-30mm long and 5-18mm wide, tapering to base, upper surface glandular.

INFLORESENCES: 1-30 flowered on a reddish hairless stalk.

FLOWERS: Autumn and Winter. White, stalked. Sepals 5-6mm long, green and red, hairless black-dotted. Stamens white with orange anthers.

Drosera menziesii

DROSERACEAE

Name Derivation Dewy / Archibald Menzies.

Plant Description

PERENNIAL HERB: To 1.2m in height. Erect or climbing, stem hairless, upper stem sometimes branched.

LEAVES: Scattered in groups of 3-5, circular, 3-5mm across, concave and facing outwards, with a central stalk with long glandular hairs on the margin and shorter hairs on the concave stalk, with long globular hairs on the margin and shorter hairs on the concave surface.

INFLORESCENCES: Branched, up to 18 flowered.

FLOWERS: Spring. Pink, stalked, sepals red. Ovate 4-5mm long, glandular hairs.

Eremaea pauciflora

MYRTACEAE

Name Derivation Flowers being terminal and solitary on shoots / Few, little flowers.

Plant Description
SHRUB: To 2m in height. Young branchlets hairy.
LEAVES: Alternate, very shortly stalked, linear 3-8mm long and 0.5-1.5mm wide, sometimes with sparse hairs.
INFLORESCENCE: Of solitary terminal flowers.
FLOWERS: Winter and early Summer. Orange, bisexual, closely surrounded by a small overlapping bracts. Stamens numerous, 7-10mm long shortly fused near the base into bundles with a basal claw of 1.5-2.5mm long.
FRUIT: More or less globular woody capsule 6-11mm in diameter, smooth, with only a small opening.

MYRTACEAE

Eucalyptus marginata subsp. *marginata*

MYRTACEAE

Name Derivation Cap covers the stamens in bud / Thickened leaf margins.

Plant Description

TREE: To 40m in height. With rough fibrous grey-brown bark usually in fairly long flat strips.
ADULT LEAVES: Narrowly ovate to ovate, often curved 80-130mm and 15-30mm wide, discolourous (shiny dark green above), tip hooked or pointed.
FLOWERS: Spring and Summer. White. Flower clusters 7-11 flowered, flower stals 5-13mm long, buds cylindric to spindle shape, 8-17mm long bud cap narrowly conic 5-9mm long.
FRUIT: Cup to barrel shaped, 9-16mm long and 9-15mm wide, disc level to slightly descending. Valves 3, enclosed or level.

Hemiandra pungens

LAMIACEAE

Name Derivation Half stamen, reduced to a tongue. / Linear.

Plant Description

SHRUB: To 0.5m in height. Usually ground-hugging, new growth sometimes with white hairs.

LEAVES: Somewhat folded lengthwise and curved, narrowly ovate, 12-22mm long and 2-5mm wide, with scattered marginal hairs.

FLOWERS: Winter to Summer. White to very pale pink-mauve with brown to purple spots in the throat. Flower stalks 1-5mm long. Calyx upper lip ovate to broadly ovate, 4.5-8mm long and spine-tipped, Calyx lower lip with 2 spine-tipped lobes 3.5-6.5mm long.

Hibbertia amplexicaulis

DILLENIACEAE

Name Derivation George Hibbert / Encircling the stem.

Plant Description **SHRUB:** To 0.7-1m. Sprawling or erect.
LEAVES: Ovate to oblong-elliptic, often greyish. 25-110mm long and 12-40mm wide, hairless with enlarged 2-lobed base, tip rounded to pointed. Margin distantly and shallowly toothed, often very slightly recurved.
FLOWERS: Winter to early Summer. Yellow, solitary, 20-45mm across on a slender hairless stalk 10-50mm long. Bracts 1 immediately below flower, ovate and stem-clasping, outer sepals ovate 10-16mm long, pointed, hairless. Fertile stamens free, 30-100 all around the ovary, several sterile stamens sometimes present outside the stamens, ovary of 5 hairless carpels.

Labichea punctata

FABACEAE

Name Derivation Jean Labiche - Freycinet's Voyage (1817-20) / Dotted with small spots or hollows.

Plant Description

SHRUB: To 1m in height.

LEAVES: Alternate, appearing simple (each actually compound but reduced to a single leaflet). Stalked, linear or narrowly elliptic to narrowly ovate 18-125mm long and 3-30mm wide, the surface net-veined and with occasional hairs, spine-tipped.

INFLORESCENCES: Of few to many flowers, with small bracts shed early.

FLOWERS: Late Winter to Spring. Yellow, stalked. 4 petals, broadly obovate, 6-12mm long.

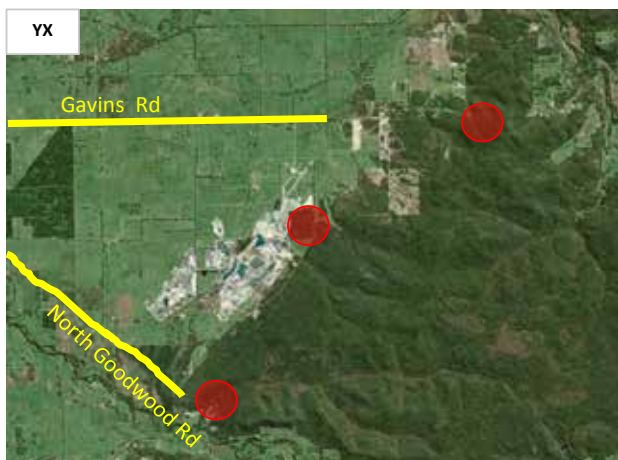

FRUIT: A stalked hairy pod, oblong-elliptic, 23-33mm long and 9-14mm wide.

Lechenaultia biloba

GOODENIACEAE

Name Derivation

Plant Description

SHRUB: To 1m in height. Often straggly.
LEAVES: 6-15mm long and 0.5-1mm wide.
INFLORESCENCE: Of loose irregular clusters often few-flowered or dense leaf clusters.
FLOWERS: Late winter and Spring. Pale to dark blue or rarely cream to white, Calyx 15-25mm long. Corolla 14-25mm long wings triangular, pointed, 3-8r
FRUIT: 23-40mm long, eventually breaking into 8-15 pairs of segments.

Lomandra preissii

ASPARAGACEAE

Name Derivation The border of the anthers in some species / Johanne Priess

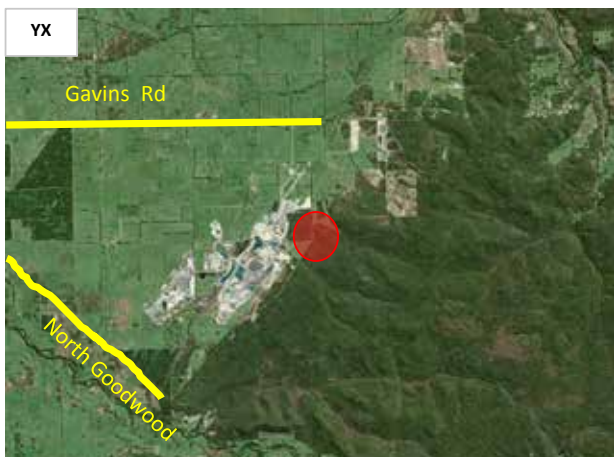

Plant Description
DIOECIOUS PERENNIAL: to 1m
LEAVES: 280-600 x 2-5mm, flat or concave, glabrous or hairy towards the base; leaf margins brown, not splitting into fibres, apex rounded
FLOWERS: Male inflorescence 200-600mm, a cylindric raceme of flowers arranged in whorled, broad clusters; 2mm long, yellow/purple
FLOWERS: Female inflorescence 250-600mm, a cylindric raceme of flowers arranged in whorled, broad clusters, sessile stigmas on ovary

Lomandra preissii

ASPARAGACEAE

Loxocarya cinerea

RESTIONACEAE

Name Derivation Oblique nut / Ash coloured - Grey.

Plant Description

PERENNIAL HERB: To 0.8m in height. Creeping hairy rhizome. Stem grey-green 1-2.5mm wide. Loosely hairy vegetative stems many branched with 1 or 2 zig-zagging branchlets at each node.

LEAVES: Brown, sheath 3-14mm long, blade 2-4mm long, with tip pointed.

SPIKELETS: Flowers in Spring. Male spikelets 2-6 per branchlets, brown, approx 5mm long. Female spikelets 1 or 2 per branchlet, brown 7-15mm long, slender usually single flowered. Style unbranched. 6 mm long densely shortly fringed.

Opercularia apiciflora

RUBIACEAE

Orianthera serpyllifolia

LOGANIACEAE

Name Derivation James Logan / Wild thyme.

Plant Description

SHRUB: Erect and open to 0.2m or compact and ground-huggin to 0.1m in height.

LEAVES: Almost stalkless to shortly stalked, narrowly ovate-elliptic to elliptic or broadly ovate, 3-16mm long and 2-7mm wide more or less hairy.

INFLORESCENCES: Of head-like terminal clusters.

FLOWERS: Late Winter and Spring. White, 8-10mm across, bisexual, bracts narrower than leaves. Calyx lobes narrowly ovate 4-5mm long, tapering to a long point, minutely fringed with a few hairs also along midvein.

Petrophile linearis

PROTEACEAE

Name Derivation Rock, to love / Linear.

Plant Description
SHRUB: to 1m in height.
LEAVES: Stalkless, flattened, usually linear to narrowly oblong or narrowly obovate and curved, 50-120mm long and 1-3(10)mm wide.
FLOWERS: Spring. Greyish pale pink to mauve, floral segments 25-35mm long, densely and loosely hairy. Flower Cones Stalkless, terminal or in the uppermost axils, outer bracts pale, very narrowly triangular, rigid and curved. Floral bracts very broadly ovate to broadly obovate 5-8mm long, smooth, hairless and pointed.
FRUIT: Ellipsoid to diamond-shaped, 2-3mm long and 2-3mm wide, with a few sparse hairs on body and with dense long marginal and basal hairs.

Podocarpus drouynianus

PODOCARPACEAE

Name Derivation Foot and fleshy stalk of fruit / Edouard Drouyn - French Diplomat.

Plant Description

SHRUB: To 3m in height. Many-stemmed, spreading. **LEAVES:** Alternate, crowded, linear 40-110mm long and 2.5-5mm wide, flat.
INFLORESCENCES: Replaced by male and female cones which occurs on separate plants.
FLOWERS: Winter to early Summer. Male Cones - Yellow to brown, 5-12mm long and 2.5mm wide with spirally arranged cone scales each with 2 pollen sacks, the cones usually solitary in leaf axils on stalks 1-25mm long or occasionally in short spikes to 65mm long. Female Cones - Green or pink with purple tip, solitary, terminating short lateral branches, approx 15mm long.
SEED: Ovoid, 15-25mm long on an enlarged Receptacle; dark blue with a grey-blue bloom, fleshy and berry-like, 20-30mm long and 10-25mm wide, 2-lobed.

Stylidium schoenoides

STYLIDIACEAE

Name Derivation The two staminal filaments are connate with the style in a column / Long narrow leaves.

Plant Description

PERENNIAL HERB: To 0.4m in height. With the leaves all in a basal tuft intermingled with pinkish scale leaves.
LEAVES: Linear, 100-330mm long and 1-2.5mm wide, grass-like, flat or with margins recurved, hairless.
INFLORESCENCES: Loose and few-flowered, the inflorescences stalk with both glandular and non glandular hairs, the flower stalks glandular-hairy.
FLOWERS: Spring and early Summer. White and cream, often with tiny red spots.
CAPSULE: Ellipsoid to broadly ovoid, 6-10mm long.

Synaphea whicherensis

PROTEACEAE

Name Derivation Refers to the membrane connecting the filament of the upper sterile anther to the stigma / Of the Whicher Scarp.

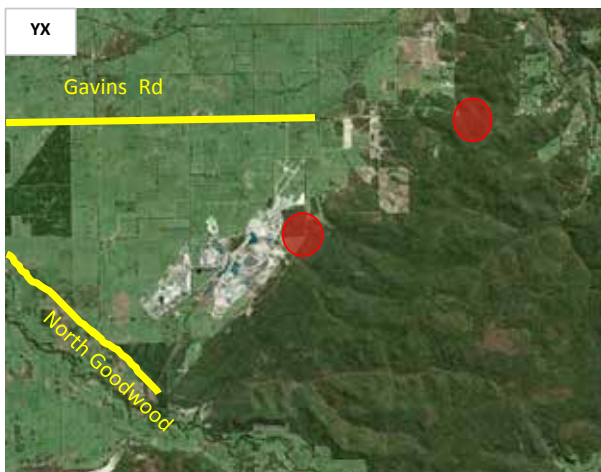

Plant Description
SHRUB: Tufted to 0.4m in height.
LEAVES: Stalk 30-50mm long, blade 30-150mm long and 50-120mm wide. Deeply divided into 3-6 curved narrow lobes, lobes linear 1.2-4mm wide, flat,
FLOWERS: Winter and Spring. Flower Spikes, 20-30mm long, the flowers crowned, bracts broad, 1-3mm long, sparsely hairy and fringed, Floral segments approx, 6mm long. Style, entire.
FRUIT: Obovoid to ellipsoid, approx 6mm long, hairless or hairy.

Synaphea whicherensis

PROTEACEAE

Taxandria fragrans

MYRTACEAE

Name Derivation Syn Agonis / Sweet smelling

Plant Description

SHRUB: to 2 m, with rigid foliage

LEAVES: spirally arranged with 1 at each node or in clusters

FLOWERS: White, large clusters, characterised by their broad bracts, broad obtuse to emarginate bracteoles and glabrous acute spels

Taxandria linearifolia

MYRTACEAE

Tetraria capillaris

CYPERACEAE

Name Derivation Four style branches / hair like, of small diameter

Plant Description

PERENNIAL: To 0.7m in height. Loosely tufted with a slender rhizome, Stems circular in cross section, 0.3-1mm wide.
LEAVES: Basal, reduced to a sheath 25-50mm long with blade a needle like point 5-16mm long and up to 0.5mm wide.
INFLORESCENCES: 5-75mm long with 1-10 spikelets, basal bract usually shorter than inflorescence.
SPIKELETS: Autumn and early winter. Brown, narrow 6-9mm long, usually 1 flowered.

Tetraria octandra

CYPERACEAE

Name Derivation Four style branches / Eight stamen.

Plant Description

PERENNIAL: To 1.2m in height. Stems circular in cross section, becoming 3 angled below inflorescences, 1-3mm wide.
LEAVES: Basal, flat leaves, 150-600mm long and 2-4mm wide. Stem leaves and bracts becoming progressively smaller up the stems.
INFLORESCENCES: To 250mm long with numerous spikelets, basal bract leaf like, usually shorter than inflorescence.
SPIKELETS: Winter and spring. Brown, 10-15mm long, 2 flowered.

Tetradlea hirsuta

ELAEOCARPACEAE

Name Derivation Four cells of the anthers / Having long hair.

Plant Description

SHRUB: To 0.9m in height. Stems circular in cross section 0.3-2.3mm wide near flowers. Sparsely branching with strong brown hairs and often also small white curled hairs.

LEAVES: Alternate, opposite or in whorls of 3 narrowly to broadly elliptic 3-25mm long and 0.5-10mm wide, usually with white hairs.

FLOWERS: Late winter and Spring. Dark pink to Purple solitary. Flower stalks 7-32mm long.

Trachymene pilosa

ARALIACEAE

Name Derivation Rough skin / Hairy.

Plant Description

ANNUAL HERB: To 0.3m in height.
LEAVES: Stalked, 5-30mm long and 5-30mm wide. Divided into 3, each segment 3 lobed.
FLOWERS: Late winter and Spring. White. Flower clusters 5-16mm across with 6-16 flowers.
FRUIT: 2-3mm long and 3-4mm wide, with both fruitlets maturing. Outer fruitlet bristled, inner hairless.

Viminaria juncea

FABACEAE

Name Derivation Rush like stems / Rush like.

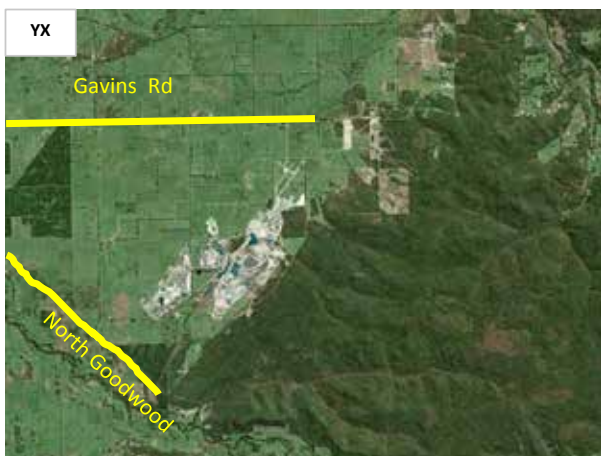

Plant Description
SHRUB: Slender to 5m in height. Often somewhat weeping with rush-like branches.
LEAVES: Mostly reduced to slender branchlet-like. Phyllodes 3-30mm long and 0.5-1mm wide. Juvenile leaves of 1-3. Narrowly ovate to ovate leaflets 10-45mm long and 4-12mm wide.
INFLORESCENCES: Loose and terminal, elongated to 200mm long.
FLOWERS: Spring and Summer. Yellow and orange to red-brown, bisexual, pea-like, stalked, each subtended by a bract. Stamens 10 all free.
FRUIT: A turgid to slightly compressed pod ovoid, ellipsoid or obovoid, 4-6mm and 2.5-3.5mm wide.

Viminaria juncea

FABACEAE

Xanthorrhoea gracilis

XANTHORRHOEACEAE

Name Derivation Refers to the yellow gum that flows from stem / Thin, slender.

Plant Description
PERENNIAL HERB: Trunkless with subterranean stem, sometimes branching.
LEAVES: Green, 500-600mm long and 2-4mm wide, 3 or 4 angled in cross-section, compressed, up to 1.6mm thick.
FLOWERS: Spring and early Summer. Flower spike dark brown to black and velvety with cream flowers. Brush-like 40-200mm long and 7-20mm wide, stalk 850-1800mm long and approx 5mm wide, usually 10 or more times length of spike. Bracts dark brown, petals large and prominent but the tips recurved.

Xanthorrhoea gracilis

XANTHORRHOEACEAE

Xanthorrhoea preissii

XANTHORRHOEACEAE

Name Derivation Refers to yellow gum that flows from the stem / Johann Pressi - Botanist.

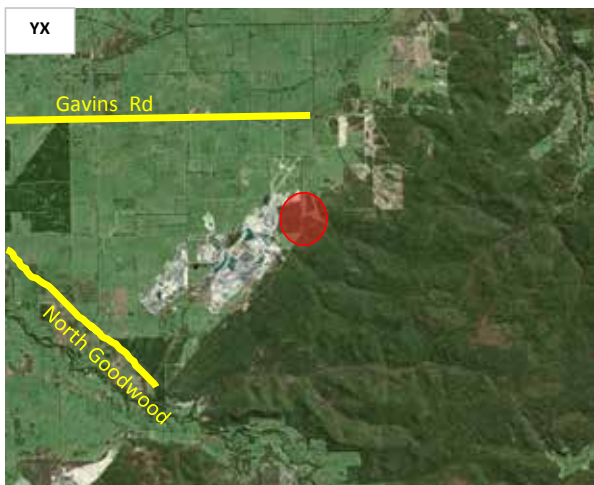

Plant Description
PERENNIAL HERB: Tree-like with trunk up to 3m high, often branching.
LEAVES: Green 600-750mm long and 2-3mm wide, 4-angled in cross-section, 2-2.5mm thick occasionally broader and more compressed.
FLOWERS: Summer. Green with cream flowers 1000-2500mm long and 20-30mm wide, stalk 600-1000mm long and 20-30mm wide. Usually hairless, petals 8-10mm wide, tips recurved.

Xanthorrhoea preissii

XANTHORRHOACEAE

Xylomelum occidentale

PROTEACEAE

Name Derivation Woody, pear shaped nuts / Western.

Plant Description

TREE to LARGE SHRUB: To 8m in height. With fibrous flaky brown bark and brown-hairy young shoots.
LEAVES: Opposite, simple, elliptic to obovate, 60-130mm long and 25-70mm wide, leathery, margins wavy and entire or prominently deeply prickly-tooth
INFLORESCENCES: A leafy arrangement of spikes, spikes to 120mm long.
FLOWERS: Summer. White to cream. Usually bisexual, regular, floral whorls single, 10-12mm long, with brownish hairs.
FRUIT: Pale brown, woody, pear-shaped, 70-95mm long and 40mm wide, separating at lengths to release 2 large, winged seeds 65-70mm long.
